Single-feature shift | magnitude 2

Construction diagnostics | seed 100 | all 10,000 rows | 20 features

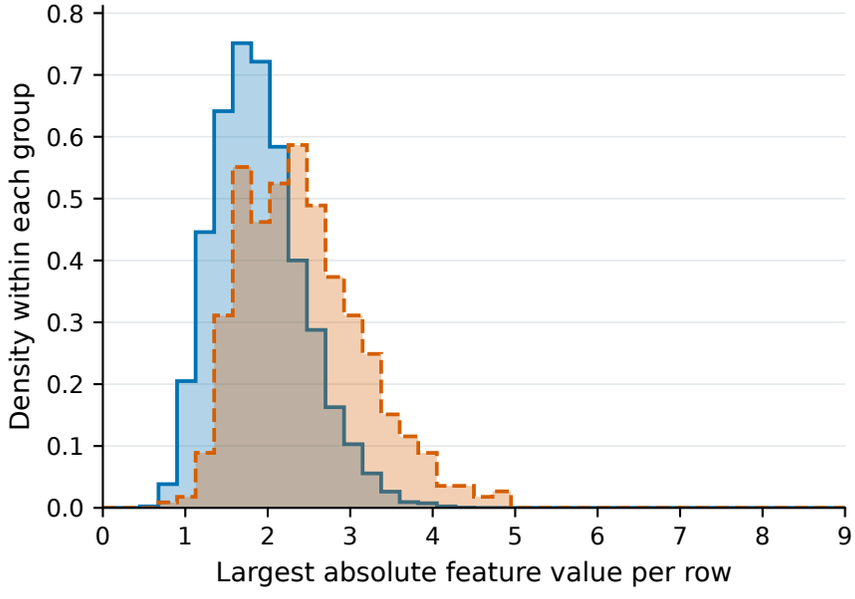

Normal origin (9,500 rows) Positive origin (500 rows)

Each positive row has one shifted feature; this also weakens its group's correlations.

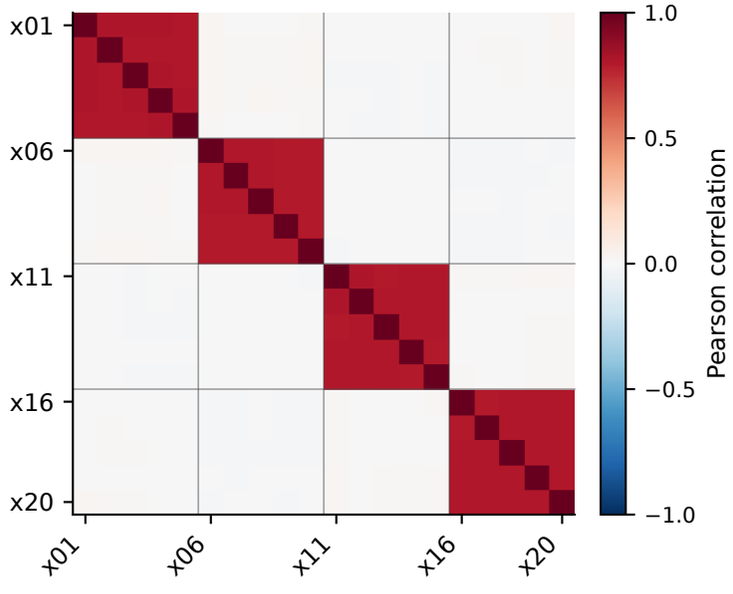

A | Two example features

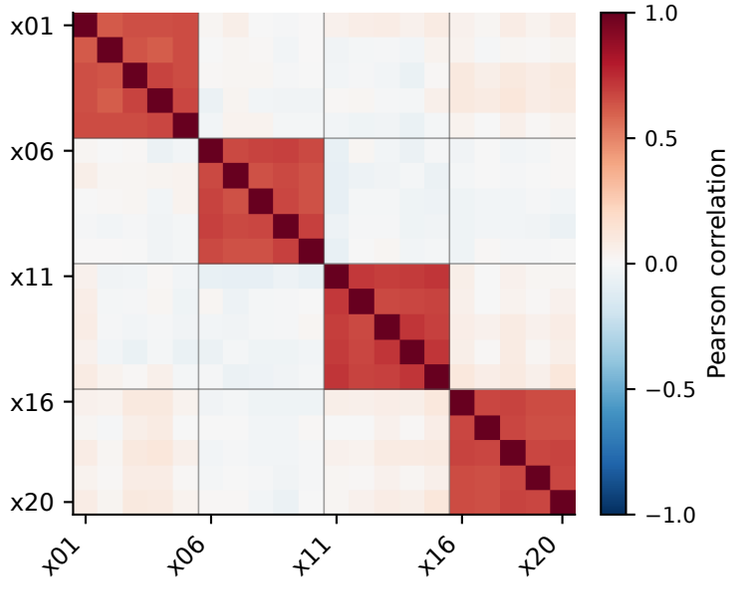

B | Extremeness across all 20 features

C | Normal origin correlations
Within-block mean 0.800; target 0.800

D | Positive origin correlations
Within-block mean 0.665; target 0.667

Shared scales within each family | Histogram is a construction summary | No models fitted
